## REVISIONS

Statistics in this publication reflect a benchmarking process that revised the previously published monthly estimates of sales for 1993 through 1995 and the end-of-month inventories by retail stores for 1994 and 1995. The revised unadjusted sales estimates reflect the results derived from the 1993 and 1994 Annual Retail Trade Surveys. Revised unadjusted inventory estimates reflect results from the 1994 Annual Retail Trade Survey.

The 1993 annual estimates of sales and purchases were revised for certain SICs prior to implementing the benchmarking operation. The end-of-year inventory estimate for 1993 for the total automotive group was also revised. As a result, all monthly inventory estimates for the SICs affected by this revision were revised for January 1993, instead of January 1994.

**Benchmarking retail sales.** We revised the monthly sales estimates for January 1993 through December 1995 in a manner which—

1. linked the revised estimates to the previously published December 1992 estimates.

2. equated the sum of the 12 monthly estimates to the 1993 and 1994 annual estimates.
3. minimized differences between the month-to-month trends of the originally tabulated estimates and the revised estimates.

**Benchmarking end-of-month inventories.** We benchmarked the inventories estimates in a manner similar to the sales estimates. (1) We linked the revised estimates to the previously published December 1993 estimates; (2) we equated the December 1994 estimates to the 1994 end-of-year estimates from the annual survey; and (3) we minimized difference between the month-to-month trends of the originally tabulated estimates and revised estimates.

**Carry-forward factors.** The 1995 monthly sales and inventories estimates were revised to be compatible with the 1994 estimates. We multiplied the originally tabulated 1995 monthly estimates by the ratios of the December 1994 (revised)-to-December 1994 (originally tabulated) estimates. These ratios are referred to as "carry-forward" factors. We will use these same "carry-forward" factors to modify the estimates of sales and inventories each month in 1996. These 1996 estimates should, therefore, be compatible with the revised 1993 through 1995 estimates.

We benchmarked specific detailed kind-of-business estimates for sales, inventories, and added appropriate estimates to derive the summary totals. This process assured additivity.

For certain SIC's, we applied corrections to the originally tabulated end-of-month inventories estimates before the benchmarking operation began. These corrections could have changed some of the previously published month-to-month trends.

The following table shows a comparison of the revised sales and inventories estimates to the previously published estimates for 1995:

## Causes For Revision

There are several reasons for revisions. The main contributors to the revision from the previously published estimates are:

**Timing.** The respondents have more time to prepare their annual reports than they do for their monthly reports. The annual responses are requested at a time when many companies have had a chance to compile audited book figures for their own purposes. The timing of the annual survey is such that we are also able to obtain independent verification of the reported data from such sources as a company's annual report to its stockholders. On the other hand, respondents to the monthly survey have just a few weeks to provide reports of their sales and end-of-month inventories. Sometimes these reports are based on incomplete or unaudited records and include estimates by the respondents to represent their understanding of their business.

**Sampling.** The annual samples are larger than the samples used to develop the estimates for any given month. As described in more detail in appendix A of this report, the samples used to produce the sales estimates each month consist of certainty companies, noncertainty employer identification numbers (EIN's), and (prior to August 1993) area sample stores.

- The companies selected as certainty companies are those companies that had large sales in relation to other companies in their kind-of-retail trade group. The monthly and annual samples are the same for certainty companies.
- The initial selection of the noncertainty EIN's was based on stratified random sampling, using annual sales as the measure of size, for those EIN's not belonging to a certainty company. The noncertainty EIN'S selected in the monthly sample were divided into 3 groups, with one group reporting on a rotating basis each month. The annual sample consists of 2 of the 3 groups of EIN's.
- The sample used for the end-of-month inventories estimates is a subsample of the monthly sales sample. The monthly inventories sample is about 1/3 the size of the monthly sales sample. This, combined with the differences between the annual and monthly surveys mentioned above, often results in greater revision for the inventories estimates than for the sales estimates.

**Response.** The annual estimates are based on more reported data than are the monthly estimates. The response to the annual retail trade survey is required by law. This requirement results in a response rate above 90 percent. The response to our monthly survey is not mandatory. The response rates for the monthly surveys are usually around 80 percent for sales and 70 percent for inventories. The sales and inventories for the nonreported retailers are accounted for by an imputation process. This process assumes that the missing businesses have trends similar to the businesses in their kind of business, that did report.

## Adjustment factors

In addition to the benchmarking operations, we developed new factors to adjust the 1993 through 1995 monthly sales estimates for seasonal variations as well as trading day and holiday differences. We used the unadjusted sales estimates for the months of January 1967 through January or February 1996 as input. We also developed new factors to adjust the 1994 and 1995 inventories estimates, using the months of December 1980 through January 1996 as input.

The seasonal adjustment program which developed the factors in this publication was the X-11 ARIMA version, developed by Statistics Canada. We developed the adjustment factors for the sales of department stores (SIC 5311), variety stores (SIC 5331), and miscellaneous general merchandise stores (SIC 5399) by the version using forecasting. We used the version without forecasting to calculate all other factors.

## Revision Of Group II Sales

We revised the Group II (see "Definition of Terms" below) estimates of sales in proportion to the revision

occurring at the all-store level. Ratios of difference were derived for each month being revised at each kind-of-business level of sales.

- We derived ratios of difference at the all-store, United States level by dividing the revised estimates of sales by the previously published monthly estimates. Separate ratios were developed for each month and each kind-of-business group.
- We multiplied the previously published group II sales estimates by the ratios of difference to derive revised group II estimates for the respective kinds of business.

## Revision of Geographic Area Sales Estimates

We revised each geographic area level of sales in proportion to the revision at the United States level. We multiplied the United States ratio of difference (see section above) by the previously published sales estimates for each published geographic area.

## DEFINITION OF TERMS

### Retail Trade

Retail trade, as defined in major groups 52 through 59 of the Standard Industrial Classification Manual: 1987, includes establishments that are engaged in the sale of merchandise for personal or household consumption and in the rendering of services that are incidental to the sale of the merchandise. Additional characteristics of retail establishments are:

- They usually operate at fixed places of business.
- They are engaged in activities to attract the general public to buy.
- They buy or receive and sell merchandise.
- They may process their products, but such processing is incidental or subordinate to selling.
- They are considered as retail in the trade.

Not all of these characteristics need be present; trade practice can modify some issues. See appendix B for the definitions of the retail SIC's.

### Sales

Sales include merchandise sold for (cash or credit at retail or wholesale) by establishments primarily engaged in retail trade. Services that are incidental to the sale of merchandise and excise taxes that are paid by the manufacturer or wholesaler and passed along to the retailer are also included. Sales are net after deductions for refunds

and allowances for merchandise returned by customers. Sales exclude sales taxes collected directly from customers and paid directly to a local, state, or federal tax agency.

The estimates of sales measure the operations receipts rendered by stores that primarily sell at retail. The sales estimates represent total sales and receipts of all establishments primarily engaged in retail trade. They do not include sales at retail by manufacturers, wholesalers, service establishments, and others whose primary activity is other than retail trade. Since the retail establishment is the basic unit of measure, the published estimates of sales by type of retail store are not intended to measure the total sales for a given commodity or merchandise line.

### Inventories

Merchandise inventories are the value of stocks of goods held for sale through retail stores. The inventories estimates represent the value, at cost, of the merchandise available for sale as of the last day of the report period. Methods of valuation may vary according to the accounting practices of each firm. The estimates provided in this report are valued on a non-LIFO (last in, first out) basis. Note - LIFO is a method of valuing inventory where the latest items of merchandise added to the inventory are the first ones taken out. Non-LIFO would mean that another method, such as FIFO (first in, first out), was used to establish the value of the inventory available for sale. Merchandise inventories are shown for stores and warehouses servicing retail establishments. Included are only those warehouses that maintained supplies of merchandise primarily intended for distribution to retail stores within the organization.

Most businesses reported the value of their inventories as of the close of the calendar year. Some businesses, using a fiscal year rather than a calendar year for accounting purposes, valued their inventory as of some date other than the last day of the calendar year. About 26 percent of the retail inventories total reported to the annual retail trade survey were on an end-of-fiscal year other than December 31. In the annual survey, inventories reported for a date in a month other than December were adjusted to a December 31 equivalent, based on ratios developed from the monthly retail inventory survey.

### Inventories/Sales Ratios

The inventories/sales ratios show the relationship of the end-of-month values of inventory to the monthly sales. These ratios can be looked at as indications of the number of months of inventory that are on hand in relation to the sales for a month. For example, a ratio of 2.5 would indicate that the retail stores have enough merchandise on hand to cover two and a half months of sales.

### Purchases

Purchases represent the total cost of merchandise that was purchased for resale during the year, whether or not payment for the merchandise was made during the year.

Purchases data include cash and credit purchases made at central offices and company warehouses. The purchases, however, exclude deliveries from central offices or warehouses to retail stores owned by other companies. We asked those companies engaged in both manufacturing and retailing to include purchases at the cost value of intercompany transfers from their plant or warehouses to their retail stores. Also, we asked these companies to include the cost of outside purchases.

### Cost of Goods Available for Sale and Cost of Goods Sold

To calculate the cost of goods available for sale, we added the purchases made during the year to the preceding year's end-of-year inventories. To calculate the cost of goods sold, we deducted the end of the current year's value of inventories from the cost of goods available for sale.

### Gross Margin

The measure of gross margin represents total sales less cost of goods sold.

### Accounts Receivable Balances

Retail accounts receivables are amounts owed to retail stores by their customers for purchases made on credit. The data in this report refer to receivables outstanding as of December 31, including receivables against which the firm has borrowed. However, credit paper discounted or sold to others and amounts actually charged off as bad debts are excluded. Also excluded are amounts charged on credit cards issued by oil companies, banks, and other organizations that issue credit cards.

Charge accounts are credit accounts for which full payment is scheduled to be made at the end of the customary billing period. Installment accounts are classified as open-end or closed-end.

- Open-end installment accounts are primarily revolving or optional accounts. A deferred payment privilege is extended through a line of credit, and the customer has the option of paying the balance in full or paying in two or more installments. The payments are subject to a minimum required payment with a finance charge usually assessed.
- Closed-end installment accounts are those generally requiring a new contract to cover each extension of credit. A precomputed finance charge is assessed at the time credit is extended. Specified fixed schedules of installment payments are established with the number, the amount of payments, and the due dates specified in the contract.

### GAF

GAF represents sales at stores that sell merchandise normally sold in department stores. GAF includes the following kinds of retail businesses:

- General merchandise group stores (SIC 53).
- Apparel and accessory stores (SIC 56).
- Furniture, home furnishings, and equipment stores (SIC 57).
- Miscellaneous shopping goods stores (SIC 594).

### Group II

Group II consists of companies that operated 11 or more retail establishments as of the latest sample revision and had annual sales large enough to qualify for certainty selection.

### Price Changes

The estimates presented in this report have not been adjusted for price changes.

### SAMPLE DESIGN

The Monthly Retail Trade Survey (MRTS) sample is a probability sample, selected from employers contained on the Census Bureau's Standard Statistical Establishment List (SSEL). The SSEL includes all employer businesses that make social security payments for employees under the Federal Insurance Contributions Act (FICA). The list sample is updated quarterly to account for new employer businesses (births) and employers which go out of business (deaths).

We previously used an area sample to account for employer births and nonemployers in retail trade. Effective with the August 1993 estimates, we dropped the area sample component from the MRTS. To account for sales and inventories for employer births and nonemployers, we implemented a benchmarking operation that adjusted the monthly estimates to the results from the annual surveys. The annual surveys include data for employer births and nonemployers. Commencing with the 1992 annual survey, we derived estimates from employer births which were added to the sample in the following year (see the section, "Sampling For New Businesses"). We also derived estimates for nonemployers from administrative records provided by other Federal agencies. The 1992 Annual Retail Trade Survey was the last one in which we used the area sample to obtain data for employer births and nonemployers.

**Initial sampling.** The sample was originally drawn from establishments of the SSEL as of December 31, 1989. The initial SSEL consisted of two lists. One list was composed of all Employer Identification (EIN) numbers (assigned in connection with FICA) with reported payroll for at least one quarter of 1989. The other list consisted of all establishments of known multiestablishment companies as of December 31, 1989. These lists contained information on sales, payroll, employment, name and address, kind-of-business classification, etc.

Before the sampling frame was available, a study was made of the universe of retail businesses using files from the 1987 Census of Retail Trade and the 1988 SSEL. This study determined the stratification of the sampling units based on 1987 sales and kinds of business. The study also determined the optimal allocation of the sample necessary to meet specified sampling variability objectives for sales of different kind-of-business groups. The primary stratum

boundary determined in the study was the certainty cutoff to be used for each kind of business. The cutoff was particularly important since it also determined the type of sampling unit.

The sampling units consisted of both companies and EIN's. If a company had total retail sales (on a 1987 basis) above the corresponding cutoff for its major kind of business or total sales for any minor kind of business above the corresponding cutoff for the minor kind of business, the company was selected into the sample with certainty (i.e., probability = 1.0). The company, which might consist of many EIN's, was considered to be the sampling unit; therefore, any new establishments that the company might acquire, even if under new or different EIN's, were in the sample with certainty. All multiestablishment retail companies, not selected with certainty, were treated on an EIN basis; that is, the EIN was the sampling unit. The EIN's were stratified according to their major kinds of business and their estimated sales (on a 1987 basis). Within each stratum, three samples of EIN's were selected. The sampling rates for these EIN's varied between 1 in 3 and 1 in 1,000. All three of these noncertainty samples are used for the monthly survey, while two are used for the annual survey. The use of these samples will be more fully explained in sections that follow.

**Sampling for new businesses (Births).** We used a two-phase selection procedure for all EIN "births", after the initial selection. EIN births are new EIN's assigned by the Internal Revenue Service (IRS) which are on the latest available IRS mailing list for FICA taxpayers. In the first phase, births are arranged by kind of business and size (expected employment or quarterly payroll). A relatively large sample is drawn and canvassed in order to obtain a more reliable measure of size (sales in two recent months) and correct kind-of-business code or a more detailed kind-of-business code, if needed.

Using this more reliable information, the births selected in phase one are subjected to probability proportional-to-size sampling with overall probabilities equivalent to those used in drawing the initial sample from the 1989 SSEL. Because of the lag in identifying births and the time needed to accomplish the two-phase birth selection procedure, births are actually added to the sample approximately 9 months after they began operation. The birth selection procedure is carried out quarterly.

The EIN births that are selected in the quarterly birth selection procedure in early November of the annual survey year are included in the main mailing of the annual survey questionnaires early in the following year.

To account for all EIN births in the annual survey year, and specifically to account for the coverage lag in the quarterly birth selection procedure, we add EIN births that are selected in the quarterly birth selection procedure in the following year. We mail annual survey forms to these births in June and August to supplement the main survey mailing. We impute for the selected births that do not report.

Selected EIN's that were reactivated in the quarterly processing, that were not included in the main mailing in January, and that had payroll in the annual survey year are treated in a similar manner to the EIN births.

To be eligible for the sample canvass and tabulation, a retail business must meet both of the following requirements:

1. It must be on the latest available IRS mailing list for FICA taxpayers from the previous quarter.
2. It must have been selected from either the SSEL or the file of employer births.

In the case of businesses that were selected into the sample with certainty, the first requirement is changed. These sampling units are not dropped from canvass and tabulation if they are no longer on the IRS mailing list. Rather, these businesses are contacted and, if there are successor businesses, they are added to the survey.

## COVERAGE

**Monthly coverage.** The companies selected with certainty are asked to submit reports covering the sales from all of their retail stores. The certainty companies are sent forms each month that request the sales for the month just ended. For example, January sales are requested during February.

EIN's selected in the three noncertainty samples are asked to report four times a year on a rotating basis. EIN's selected in the same sample are asked to report the sales for the month just ended and the month prior to that month for the retail stores operated under the selected EIN. For example, the EIN's selected in the first sample are asked to report their January and December sales during February; April and March sales during May; July and June sales during August; and October and September sales during November.

The sample used for the Monthly Retail Inventories Survey is a subsample of the Monthly Retail Sales Survey and the coverage is similar to that described above.

**Annual coverage.** The Annual Retail Trade sample consists of the certainty companies plus EIN's selected in two of the three noncertainty list samples.

## ESTIMATION

**Monthly estimates.** The current month's weighted data (January in the example above) from the certainty companies are added to the similar current month's data from the EIN's in the first sample to develop the current month unbiased estimates of January sales and end-of-month inventories for retail stores. Previous month unbiased estimates of December sales and end-of-December inventories are also developed from the first sample of retailers in a similar manner.

The preliminary composite estimate for a particular SIC level is the weighted average of the current month unbiased estimate (weight 0.25) and a ratio estimate (weight 0.75) obtained by multiplying the ratio of the current-to-previous month unbiased estimates, as measured by the first sample, by the preliminary composite estimate for the previous month.

In March, the EIN's in the second noncertainty sample are asked to report their February and January sales and end-of-month inventories for each of those months. Therefore, we will have reports of January sales and inventories from two different groups of retailers (the current month from the first list sample plus the previous month from the second list sample). The January data from the two noncertainty list samples and the certainty companies are combined to derive the final January composite estimates. The final composite estimates for individual kind-of-business levels are also weighted averages of two estimates - the preliminary composite estimate for January (weight 0.8) and the previous month unbiased estimate (weight 0.2) for January, as obtained from the February reporting panel.

**Annual estimates.** We derived the annual sales, purchases, accounts receivables, and value of inventories published in this report from the Annual Retail Trade Survey. Data from the annual survey were based on the summation of weighted data reported by the sampling units selected for the survey. We made the sales, purchases, and inventories estimates for 1992 through 1994 comparable to sales derived in the 1992 Census of Retail Trade as follows:

- For employer data, we multiplied the results from the annual survey by the ratio of 1992 Census of Retail Trade sales estimates to the 1992 sales estimates derived in the annual survey.
- For nonemployers, we used data obtained in administrative records from other Federal agencies.
- We summed the estimates for employers and nonemployers to derive the published estimates.

## RELIABILITY OF DATA

An estimate based on a sample survey will differ from the population value because of sampling variability and nonsampling error. Sampling variability occurs because

observations are made only on a sample, not on the entire population. Nonsampling errors can be attributed to many sources in the reporting, collection, and processing of data. The accuracy of a survey result is determined by the joint effects of sampling variability and nonsampling errors.

The particular sample used for the Annual and Monthly Retail Trade Surveys is one of a large number of all possible samples of the same size that could have been selected using the same design. Estimates derived from different samples would differ from each other. The average of these estimates would be close to the estimate derived from a complete enumeration of the population. This assumes that a complete enumeration has the same nonsampling error as the sample survey.

The standard error of the estimate is a measure of the variability among the estimates from all possible samples of the same size and design and thus is a measure of the precision with which an estimate from a particular sample approximates the results of a complete enumeration. The coefficient of variation (expressed as a percent) is the standard error of the estimate times 100 divided by the value of the estimate derived from the sample and are also subject to sampling variability. Estimates of coefficients of variation in percent for the National level estimates are shown in tables A-1 through A-3.

Coefficients of variation for the sales estimates at various geographic areas are contained in the Current Business Reports Monthly Retail Trade, Sales and Inventories.

The coefficients of variation presented in the tables permit certain confidence statements about the sample estimates. As noted before, the particular sample used in this survey was one of a large number of samples of the same size that could have been selected using the same design. In about two out of three of these samples (67 percent), the estimate would differ from a complete enumeration by less than the corresponding percentage for that estimate shown in tables A-1 through A-3. In about 9 out of 10 of these samples (90 percent), the estimates would differ from the results of a complete enumeration by less than 1.65 times the percentages shown.

The coefficients of variation shown in this report do not measure biases which might arise from difference of response or nonreporting. Nonresponse amounted to about 9 percent for the annual sales, 20 percent for the monthly sales, 10 percent for the end-of-year inventories, 29 percent for the end-of-month inventories, 20 percent for annual purchases, and 7 percent for accounts receivable on the basis of total dollar volume estimates.

## NONDURABLE GOODS

**General Merchandise Group Stores (SIC Major Group 53)**

2. A general line of apparel for the family.
3. Household linens and dry goods.

To qualify as a department store, sales of each of the lines listed above must be less than 80 percent of total store sales. An establishment with total sales of \$10 million or more is classified as a department store even if sales of one of the merchandise lines listed above exceed the maximum percent of total sales, provided that the combined sales of the other two groups are \$1 million or more. Department store sales have been separately presented for the following classifications:
